

**IN THE SPECIFICATION:**

Please amen Page 11, Lines 6-24 to read as follows:

In this embodiment, as shown in Fig. 5 and Fig. 6, each length of all or a part of the optical fibers 4 is made to be different so that the binding binding part 41 is located to deviate to either one of two directions in a plane view with respect to a center line of the light irradiating part 21. The optical fiber 4 itself is elastic so that it can be bent, however, it is difficult for the bound optical fiber band 4A as noted above to bend to deviate the binding part 41 of the optical fiber 4 toward the direction of the line P. As a result, with the arrangement of this embodiment wherein the light sources 6 are arranged along a direction of a depth (the direction of the line) P and each light source 6 is located to deviate from the center line of the light emitting part 2 in order to secure downsizing toward the direction of the thickness, this shape that the binding part 41 has been deviated from the center line of the light emitting part 2 before is very effective. In this embodiment, four identical optical fiber bands 4A are formed and mounted two-by-two with its front and back sides turned upside down.
